AGENTIC INVESTOR UPDATES

Your update is already written. Every number shows its source.

For founders who owe investors a monthly update. The agent collects your month while it happens, and you confirm each fact **before it reaches your investors.**

Built with Claude, Jamie and Reson8

Demo runs on **Reson8**. Funding, languages, pricing and SDK downloads are public. Revenue, burn and customer names are invented for the demo.

THE PROBLEM

It's the 31st. The update is due.

- You open a blank doc at eleven at night.
- You scroll Slack, Stripe, GitHub and your own calendar, piecing the month back together.
- **You remember the wins faster than the churn.**
- Investors get it three days late, and they cannot check a single number in it.

60%

of investors don't hear from their companies regularly.

3x

as likely to raise follow-on funding when a startup sends regular updates.

Source: Visible, which sells investor-update software. It hasn't published the data behind either figure.

The hard part is remembering the month.

THE INSIGHT

You write the update when you remember the least.

Ebbinghaus measured it in 1885. Most new detail fades within days, and after a month about a fifth is left. That is when you sit down to write.

By then you are rebuilding the month from memory, and **memory keeps the good parts.**

Shape after Ebbinghaus's forgetting curve (1885), measured on memorised syllables

---

So capture it in week one, while you still remember it.

THE PRODUCT

An agent that works all month, so at month end you only approve.

01

Confirm, don't write

Every week it shows what it already found. You confirm, edit or dismiss. There is no blank page.

02

It chases the gaps

When a number looks wrong it works out who owns it and drafts them a Slack message. Nothing sends without your approval.

03

Numbers open sources

The update is built only from facts you confirmed. Click any figure to see where it came from.

Your job each week: say yes, or fix it.

LIVE

Demo: October, start to finish.

0:00 **Oct 7.** Run the week 1 check-in. It has already read the sources and found facts to confirm.

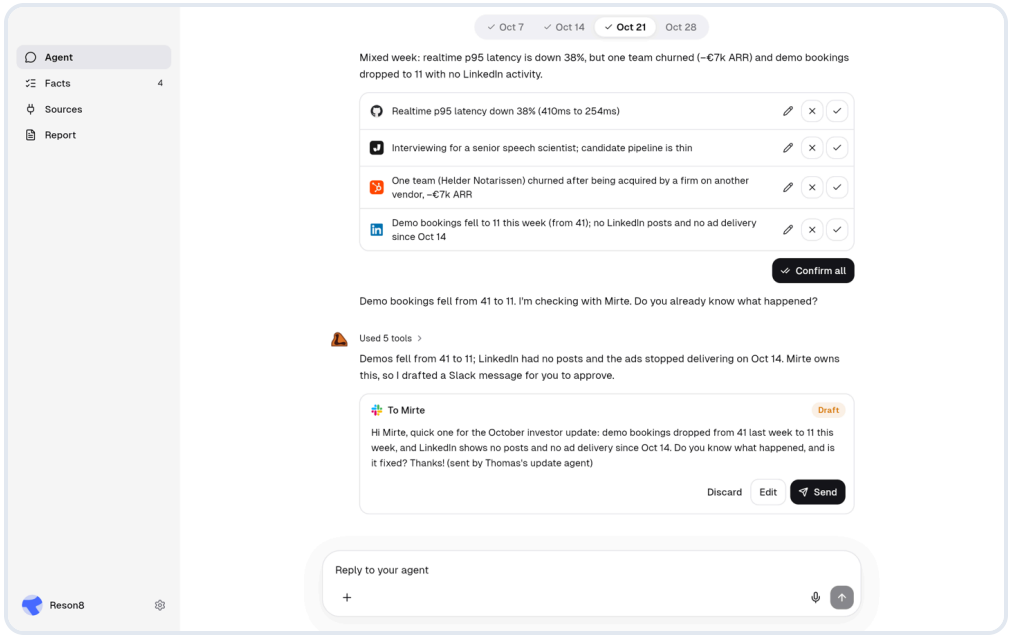

0:22 Jamie heard your lead investor ask for NRR. You click **Add**.

0:32 Add a fact by voice, and it spells **NRR** correctly.

0:54 **Oct 21. Demos fell from 41 to 11.** It drafts the question to Mirte.

1:26 The report. Click any number, get its source.

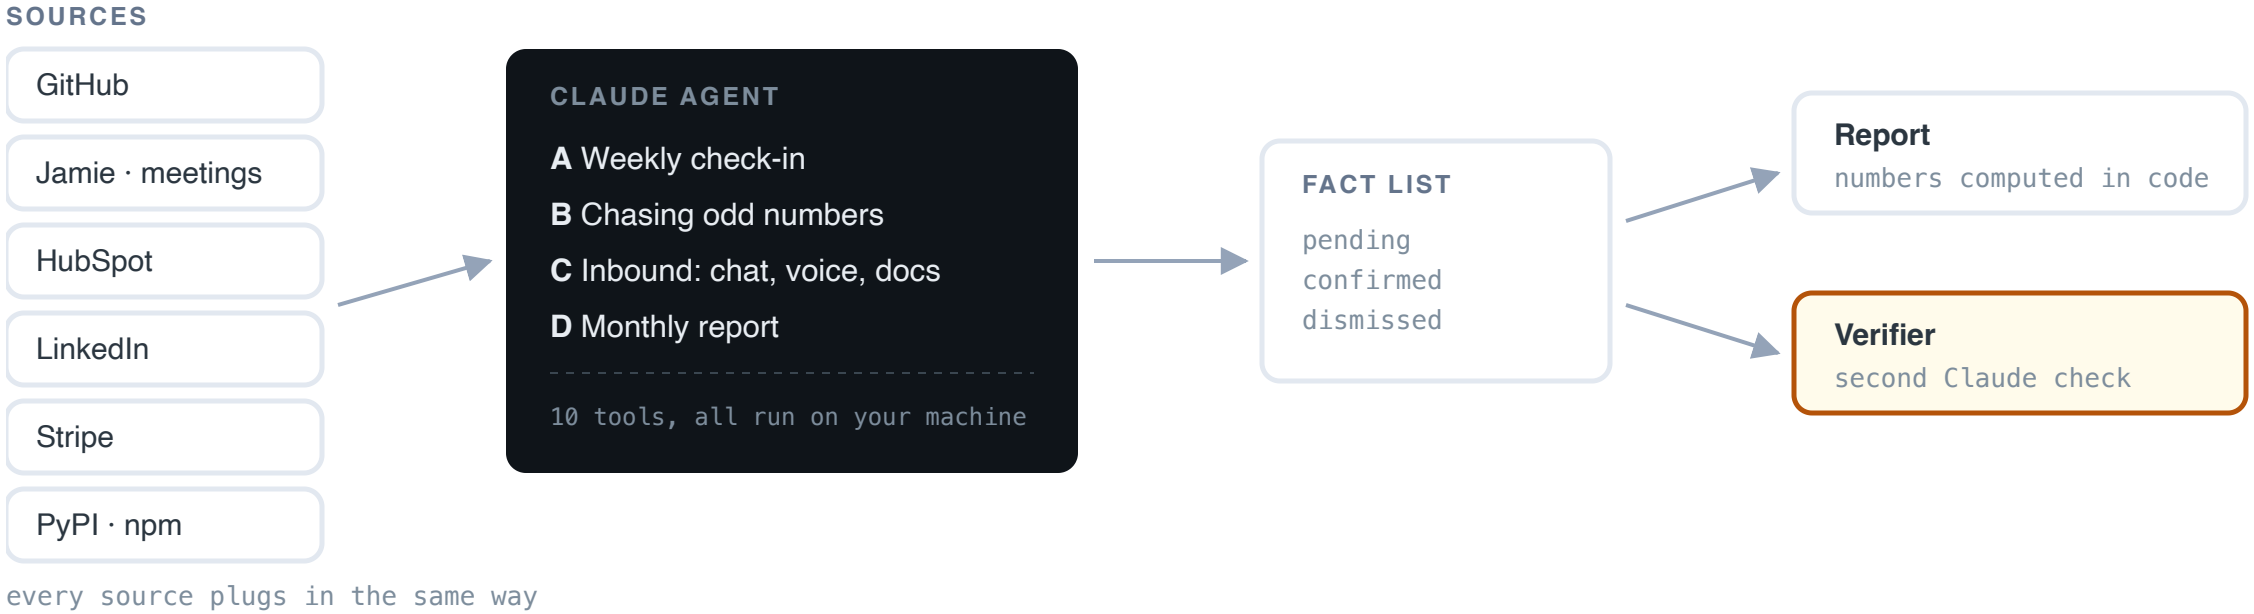

2:00 The verifier keeps out the one claim nobody put in writing.

If the demo stalls, the next slide is the backup recording.

UNDER THE HOOD

Why it can't make up a number.

The model writes the sentences. Every number comes from a fact you confirmed, and a second check reads only those facts.

BUILT WITH

Three parts we didn't build ourselves.

Claude

Sonnet 5.5

Runs the loop, proposes facts, spots the anomaly and drafts the update. Then a second, separate call audits that draft against the ledger.

A second call checks the draft.

Jamie

Bot-free meeting notes, EU

Two facts this month exist only because Jamie was in the room: the lead investor asking for NRR, and the clinic rollout nobody has signed.

It catches facts that were only said out loud.

Reson8

Speech-to-text tuned to your words, EU

We hand it the vocabulary a founder actually uses: ARR, NRR, churn, runway, customer names. Then the founder can just talk.

Generic speech-to-text can't spell NRR.

GENERIC SPEECH-TO-TEXT

"an are are is up to 112 percent and noorder licht wants all fourteen clinics in cue one"

RESON8 WITH OUR VOCABULARY

"**NRR** is up to 112% and **Noorderlicht** wants all 14 clinics in **Q1**"

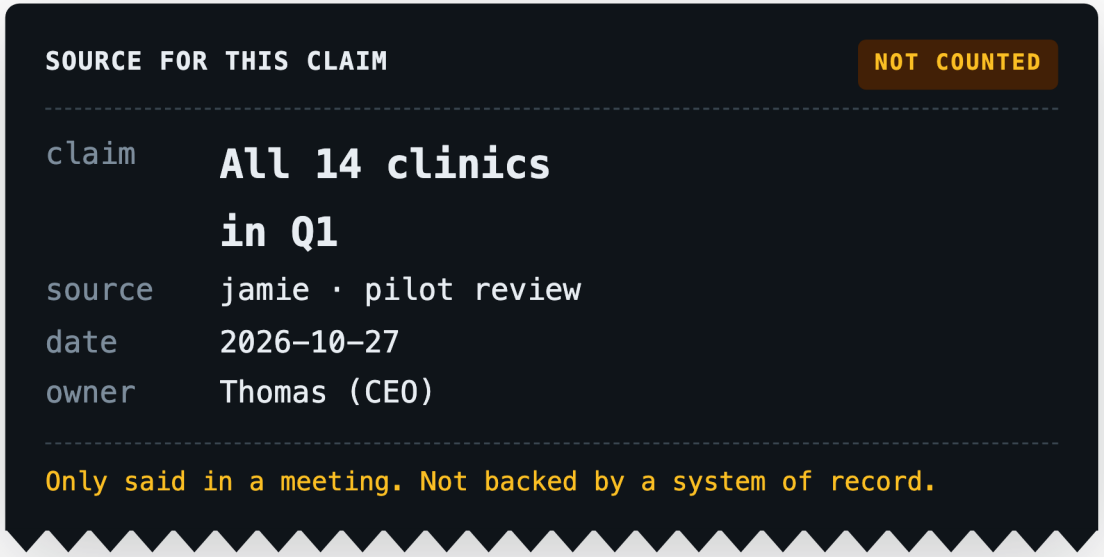

WHY IT MATTERS

Today investors can believe your update or not. They can't check it.

— Every fact is captured weekly from its source, and nothing reaches the update without one

— **A confirmed lowlight goes in the same way a win does.**

You confirm facts each week instead of losing an evening on the 31st, and your investors get **numbers they can check.**

The best line in our update, the fourteen clinics, is the one the agent wouldn't let us claim.

Owe investors an update this month? Run it on yours tonight: **github.com/seanjanke/Agentic-Investor-Updates**. No API key needed.

OPTIONAL · THE LEDGER

How a fact gets into the update.

- **Proposed.** The agent reads a source and writes a candidate fact. It never invents a number.
- **Pending.** It waits in the feed for the founder.
- **Confirmed. Only these are visible to the report writer.**
- **Dismissed.** Kept on record, and never reaches the report.

FACT

```
id      a3f1
text    "ARR at end of October: €413k"
value   413000
unit    EUR
source  stripe
owner   thomas
status  confirmed
kpiKey arr
```

The report writer cannot see a fact you have not confirmed.

OPTIONAL · OCTOBER AT RESON8

The month the agent assembled.

KPIS · OCTOBER 2026

ARR	€413k	+17%
Paying teams	44	+3
NRR	112%	+8pp
Net burn	€231k	+33k
Cash	€3.89M	−231k
Runway	17 months	−4

LOWLIGHTS, NEVER SKIPPED

One team churned after an acquisition, −€7k ARR. Burn up €33k on two speech engineers. Runway down four months.

DEFAULT ALIVE?

Yes, if ARR keeps growing 17.3% a month: break-even in 13 months with €1.83M left. Below 8.6% it flips to dead. Default alive means you reach profit on current growth before the cash runs out.

> **"All 14 clinics in Q1"** not counted: said in a meeting only.

Every figure is clickable and every click opens the fact behind it.

The churn and the shorter runway are in the update for the same reason the ARR is. A confirmed fact exists, so it goes in.

ARR · Teams · NRR · Burn · Cash · Runway

NRR was not in the KPI set on 1 October. The agent added it after Jamie caught the lead investor asking for it.

OPTIONAL · WHAT IS REAL

What runs, and what is a fixture.

Real

The Claude agent loop and all ten tools, strict JSON schemas, the facts ledger, the report writer, the verifier pass, the approval gate on outbound messages, and the whole interface. Tools execute locally and deterministically. The KPI table is computed from the ledger in code, never written by the model.

Mocked

The six connectors read timestamped JSON instead of live APIs, and a simulated week selector steps through October, so a month of founder life fits into ninety seconds. The PyPI and npm download counts in that JSON are real. Teammate replies arrive from a button rather than Slack.

Every connector already implements one interface, so a real one drops in:

```
abstract class SourceConnector {
  String get id;
  Future<List<SourceItem>> fetch(
    DateTime since, DateTime until);
}
```

Next to connect:

Granola · Salesforce · Linear · Notion · Google Analytics · Any dashboard · Computer Use

Scheduling is the other swap. The week selector stands in for a cron job per founder, and anomaly checks would run from webhooks.

OPTIONAL · THE BUSINESS

Why it gets used every month instead of once.

PULL

The deadline is someone else's

Investors ask for the update whether or not the founder feels like writing, so the monthly habit is already there.

MOAT

History builds up

Each confirmed fact makes next month's draft easier to check. After a year the ledger holds twelve months of confirmed history.

WEDGE

Sources travel

The same verified ledger answers a data room request, a board pack and a diligence questionnaire. The monthly update is only the first document.

The monthly update comes first. The same facts can fill a board pack or a diligence request later.
